

## Screen Design changes:

There were some changes from the original screen designs. These changes included an updated tabs bar where the settings options were located on a fab button on the home screen. I also added in a section for motivational quotes.

## Implementation Details

### Issues that I had:

Issues that I had originally were modals, but I quickly figured out how to create them, I also had an issue with the graph.js plugin, it wasn't displaying my data. I later figured out that this was occurring because the Data array was in the wrong section of the object. Once I had moved this it worked perfectly

### Interesting Features:

I decided to add in a feature that wasn't talked about in class, I used the Email Composer Ionic and Cordova plugin and created a service that controls a function which sends off an email with the information from the journal entry objects. The aim of this was so that the psychologist can get updates of their patient. This was a fun thing to research and achieve and it used many variables that I had already implemented into the app. This wasn't a required thing for this assignment but I decided to do it for fun.
